
The Annotated Bibliography

Remember that academic essays often need significant and appropriate support via research that will be documented in a works cited page. By documenting each source as you find it, you're saving yourself a ton of time when it comes time to write the works cited page for the essay.

In an annotated bibliography, you're documenting each source as you do research. Make sure to follow MLA style for each entry, and, when finished documenting it, simply write a few words to remind yourself what the article was about, why you wanted to use it, where the quote is and how it pertains to your thesis, etc.

What's the difference between an annotated bibliography and a works cited page?

Annotated Bibliography: *making a list of your sources as you do research, and making notes about the content of each source for future reference. You might or might not use any of these in your essay -- these are just the ones you're considering so far.*

Works Cited: *a separate page at the end of your essay that lists only the sources you actually used in your essay -- they can be direct quotes, rephrased summaries, data, or even statistics. Any information you borrow from somewhere else, anything that isn't common knowledge, needs to be cited according to MLA style. If you've already done this in an annotated bibliography, then all you have to do here is cut and paste, leaving out the annotations.*

Make sure you don't title your essay's Works Cited page as an Annotated Bibliography. They are two different things.

1. Just cite the article according to MLA standards.
2. Then briefly summarize what it talks about

Citation	Kartaras, Eleni. "The Effect of Video Games on the Brain." <i>CNET news</i> . CBS Interactive, 7 Jan. 2008. Web. 19 Nov. 2010.
<i>summary</i>	The number of people who play video games are on the rise. There are studies showing that video games can increase aggressive behavior, decrease self control, and increase emotional outbursts. Thousands of reports and studies on television violence show that watching violence on television can increase anger and aggression. The author proposes that we can infer that "video game violence may also contribute to aggressive behavior and desensitization to violence." Studies showed that the more video games that subjects played, the lower the frontal lobe brain activity was. The frontal lobe is responsible for emotion, and controls aggression. The brain also believes that video game situations are real, and therefore releases chemicals such as adrenaline, which increases heart rate and blood pressure. The increased amount of adrenaline may account for the player's change in mood. This article includes many links to articles with
